There are two main ways to deal with the ever-increasing pollution that is contaminating our air, water and soil: mitigation and adaptation. Mitigation involves prevention of the problem before it arises by reducing the amount of carbon emissions in our atmosphere. This can be achieved by switching from harmful fossil fuels to clean, renewable energy such as solar, wind and wave power and other sustainable means, as well as reducing traffic and changing individual daily habits.

global warming, whatever their background. Comprehensive introduction to the history and science of the major air pollution and climate problems facing the world today, as well as energy and policy solutions to those problems.

A 25-year tradition of excellence is extended in the Fourth Edition of this highly regarded text. In clear, authoritative language, the authors discuss the philosophy and procedures for the design of air pollution control systems. Their objective is twofold: to present detailed information on air pollution and its control, and to provide formal design training for engineering students. New to this edition is a comprehensive chapter on carbon dioxide control, perhaps the most critical emerging issue in the field. Emphasis is on methods to reduce carbon dioxide emissions and the technologies for carbon capture and sequestration. An expanded discussion of control technologies for coal-fired power plants includes details on the capture of NO<sub>x</sub> and mercury emissions. All chapters have been revised to reflect the most recent information on U.S. air quality trends and standards. Moreover, where available, equations for equipment cost estimation have been updated to the present time. Abundant illustrations clarify the concepts presented, while numerous examples and end-of-chapter problems reinforce the design principles and provide opportunities for students to enhance their problem-solving skills.

Examines the causes of atmospheric pollution, acid rain, ozone depletion, and global warming and explains how these conditions affect human health and economic prosperity.

Nothing is as elemental, as essential to human life, as the air we breathe. Yet around the world, in rich countries and poor ones, it is quietly poisoning us. Air pollution prematurely kills seven million people every year, including more than one hundred thousand Americans. It is strongly linked to strokes, heart attacks, many kinds of cancer, dementia, and premature birth, among other ailments. In *Choked*, Beth Gardiner travels the world to tell the story of this modern-day plague, taking readers from the halls of power in Washington and the diesel-fogged London streets she walks with her daughter to Poland's coal heartland and India's gasping capital. In a gripping narrative that's alive with powerful voices and personalities, she exposes the political decisions and economic forces that have kept so many of us breathing dirty air. This is a moving, up-close look at the human toll, where we meet the scientists who have transformed our understanding of pollution's effects on the body and the ordinary people fighting for a cleaner future. In the United States, air is far cleaner than it once was. But progress has failed to keep up with the science, which tells us that even today's lower pollution levels are doing real damage. And as the Trump administration rips up the regulations that have brought us where we are, decades of gains are now at risk. Elsewhere, the problem is far worse, and choking nations like China are scrambling to replicate the achievements of an American agency—the EPA—that until recently was the envy of the world. Clean air feels like a birthright. But it can disappear in a puff of smoke if the rules that protect it are unraveled. At home and around the world, it's never been more important to understand how progress

happened and what dangers might still be in store. Choked shows us that we hold the power to build a cleaner, healthier future: one in which breathing, life's most basic function, no longer carries a hidden danger.

Like it or not, our children are inheriting a polluted world. By studying the effect of toxins on wildlife, understanding the societal problems posed by pollution, and participating in recycling and clean-up projects, kids can become proactive in preserving the future of our planet.

Recent publications on the fate of our limited earth have stirred up vivid worldwide discussions, during which it became clear that our knowledge of the complex ecosystem is far from sufficient today. All planning and predictive models are only as good as the input data they are based on. Improved research methods and new ideas and impulses are therefore urgently needed, both to stimulate the specialized scientists and to supply the concerned citizen with the updated background information necessary to make responsible decisions. Generally, most of the serious publications in the field of pollution are written by well-known and well-established scientists. It is beyond doubt that their experience and profound knowledge is an essential contribution to the understanding of our environment. But one whole group of scientists has not been able to present their ideas and concerns to a broader scientific or non scientific readership: the young scientist at the beginning of his career. He belongs to a new generation of scientists who have studied during a time when environmental concern has

become a vital part of the university life. Now, in the first decade of his academic career, his educational approach and his developing expertise in this field may synthesize ideas that will fall on what is already a fertile ground for new concepts that are urgently needed to solve the environmental crisis.
