One of the few books to cover all aspects of cyclin-dependent kinases (CDKs), Inhibitors of Cyclin-dependent Kinases as Anti-tumor Agents provides an overview of CDKs as molecular and functional entities, their involvement in different disease processes, and their potential for pharmacological modulation. With contributions from the top international researchers in the field, the book takes a contemporary approach to study the importance of rational drug design and knowledge-based therapeutics in relation to CDKs. The first two sections of the book discuss the integration of cell cycle control pathways, opportunities for targeting, targets of inhibitors, and the evaluation of CDK inhibitors, exploring topics such as the in vivo function of CDKs in normal homeostasisand tumor development and the structural biology of CDKs. The third section examines the design, development, and chemistry of small molecule CDK inhibitors, with discussions ranging from the early-stage discovery of new chemical entities with a capacity to inhibit CDKs to late-stage compounds in clinical development. The final section assesses the current status of CDK inhibitors in clinical trials, the therapeutic deployment challenges of small molecule inhibitors, and the future development of CDK inhibitors as anticancer agents. The field of drug development is at a critical point in terms of understanding the availability, advantages, and drawbacks of CDKs as therapeutic targets for small molecules. Providing the most up-to-date, in-depth coverage available in a single volume, Inhibitors of Cyclin-dependent Kinases as Anti-tumor Agents surveys the success of the agents developed thus far, the possibility of new routes to more selective inhibitors, and the growing appreciation of critical, therapeutic issues.

More than 10 years ago, the discovery of cyclin-dependent ki nases (Cdk) ushered in a new era in the understanding of cell proliferation and its control. Not only were both of the known cell cycle transitions, from G 1 to S phase and G2 to M phase, found to be dependent on these protein kinases, but the reg ulatory assumption intrinsic to cyclin-dependent kinases, a stable inactive catalytic subunit (the Cdk) and an unstable requisite positive regulatory activating subunit (the cyclin), led to a simple model for cell cycle control. Modulation of cyclin accumulation, and thereby Cdk activation, was proposed to be the overarching principle governing the passage through cell cycle phases. An other reality to emerge from the discovery of Cdk was the ex ceptional degree of evolutionary conservation maintained in the machinery and organization of proliferation control. Not only were Cdk shown to be structurally conserved between yeast and man, but mammalian Cdk could substitute functionally for the endogenous enzymes in a yeast cell. The problem of cell cycle control was thought to have been virtually solved. The ensuing years have provided a much more complex view of cell cycle control and the role and regulation of Cdk. The uncritical enthusiasm with which many of the ideas were embraced has required tempering. For example, although Cdk appear to be highly conserved phylogenetically, cyclins are much less so.

A panel of leading academic and pharmaceutical investigators takes stock of the remarkable work that has been accomplished to date with proteasome inhibitors in cancer, and examines emerging therapeutic possibilities. The topics range from a discussion of the chemistry and cell biology of the proteasome and the rationale for proteasome inhibitors in cancer to a review of current clinical trials underway. The discussion of rationales for testing proteasome inhibitors in cancer models covers the role of the proteasome in NF- $\kappa$ B activation, the combining of conventional chemotherapy and radiation with proteasome inhibition, notably PS-341, new proteasome methods of inhibiting viral maturation, and the role of proteasome inhibition in the treatment of AIDS. The authors also document the development of bortezomib (Velcade<sup>TM</sup>) in Phase I clinical trials and in a multicentered Phase II clinical trials in patients with relapsed and refractory myeloma.
