If we were to divide the system into two halves, each half weighs  $W/2$  and occupies a volume of  $V/2$ . The specific weight of one of these halves is  $\gamma = \frac{W/2}{V/2} = \frac{W}{V}$  which is the same as the original specific weight.

problems provide the “ deliberate practice ” —with feedback—that leads to material mastery, and discussion of real-world applications provides a frame of reference that enhances student comprehension. The study of fluid mechanics pulls from chemistry, physics, statics, and calculus to describe the behavior of liquid matter; as a strong foundation in these concepts is essential across a variety of engineering fields, this text likewise pulls from civil engineering, mechanical engineering, chemical engineering, and more to provide a broadly relevant, immediately practicable knowledge base. Written by a team of educators who are also practicing engineers, this book merges effective pedagogy with professional perspective to help today ’ s students become tomorrow ’ s skillful engineers.
