'What a pleasure to find, at long last, a book on rural livelihoods which does not package sustainability through the straightjacket of assessment, numbers and capital' - Development and Change Livelihood systems are much more than sets of material and economic conditions. They have to cater to a large number of human needs including food and shelter. The contributors to this important volume adopt a holistic approach to understanding rural livelihood systems. They maintain that a livelihood system embraces not just economic conditions for physical subsistence, but all the elements that provide material continuity and cultural meaning to the life of a family in a community. This book tries to understand 'rural livelihood systems' from different angles and throws light on the question of what people need in order to feel secure within their systems.

Livelihood systems are more than sets of material and economic conditions. They cater to a number of human needs. The contributors to this volume maintain that a livelihood system embraces not just economic conditions for physical subsistence but provides material continuity and cultural meaning to the life of a family.

Globally climate-induced disasters have been impacting marginalised communities' lives, livelihood and gendered relations. This book explores the effects of Cyclone Aila (as a result of climate change) in 2009 on the rural livelihoods and gendered relations of two ethnically distinct forest communities – Munda, an indigenous group, and Shora, a Muslim group – dwelling near the Sundarbans Forest in Bangladesh. Examining the cyclone's medium- to long-term impacts on livelihoods and comparative aspects of gendered relations between these two contrasting communities, this book addresses a gap in current critical development studies. It adopts an ethnographic research design and analyses the alterations to livelihood activities and reconfiguration of gender relations within the Munda and Shora communities since 2009. The study primarily contends that post-Aila, livelihoods and gendered relations have been substantially transformed in both communities, making the case that the improvement of local infrastructure, as an important part of the geographical location, has noticeably progressed the living conditions and livelihoods of some members of the Munda and Shora communities. Connecting climate-induced changes with the construction and alteration of gendered livelihood patterns, the book will be of interest to a wide range of academics in the fields of Asian Studies, Sociology of Environment, Social Anthropology, Human Geography, Gender and Cultural Studies, Human Geography, Disaster Management and Forestry and Environmental Science.

A joint FAO and World Bank study which shows how the farming systems approach can be used to identify priorities for the reduction of hunger and poverty in the main farming

systems of the six major developing regions of the world.

Very few studies have been conducted to explore the vulnerability of women in the context of climate change. This book addresses this absence by investigating the structure of women ' s livelihoods and coping capacity in a disaster vulnerable coastal area of Bangladesh. The research findings suggest that the distribution of livelihood capitals of vulnerable women in rural Bangladesh is heavily influenced by several climatic events, such as cyclones, floods and seasonal droughts that periodically affect the region. Women face several challenges in their livelihoods, including vulnerability to their income, household assets, lives and health, food security, education, water sources, sanitation and transportation systems, because of ongoing climate change impacts. The findings have important policy relevance for all involved in disaster and risk management, both within Bangladesh and the developing countries facing climate change impacts. Based on the research findings, the book also provides recommendations to improving the livelihoods of women in the coastal communities. This book will appeal to academics, researchers and professionals in environmental management, gender and development, and climate change governance looking at the effects of and adaptation to climate change, gender issues and natural disaster management strategies.

Land tenure in pastoral and agro pastoral areas of Tanzania is under stress. The stress emanates mainly from changing natural and demographic environments. Other underlying causes are social, economic and political changes. In the past three to four decades, both pastoral and agro-pastoral areas have been experiencing rapid population increase, with a national mean population growth rate estimated at 3 per cent per annum (Kurian 1992). This has increased demand for cultivation lands, forcing pastoralists and agro-pastoralists to more marginal areas and triggering off in some cases environmental degradation process. These processes are paralleled by overall climatic changes with concomitant increasing droughts. The combined effect of these processes has culminated into a general decline of pastoral and agro-pastoral communityis welfare and increased livelihood insecurity. This study explored the impacts of these changes in agro-pastoral land use on the physical environment as well as livelihood and welfare of the community in Missungwi District.
