University Physics provides an authoritative treatment of physics. This book discusses the linear motion with constant acceleration; addition and subtraction of vectors; uniform circular motion and simple harmonic motion; and electrostatic energy of a charged capacitor. The behavior of materials in a non-uniform magnetic field; application of Kirchhoff's junction rule; Lorentz transformations; and Bernoulli's equation are also deliberated. This text likewise covers the speed of electromagnetic waves; origins of quantum physics; neutron activation analysis; and interference of light. This publication is beneficial to physics, engineering, and mathematics students intending to acquire a general knowledge of physical laws and conservation principles.

<p>This is an extensively revised edition of Paul Tipler's standard text for calculus-based introductory physics courses. It includes entirely new artwork, updated examples and new pedagogical features.</p>

Designed for medical professionals who may struggle with making the leap to conceptual understanding and applying physics, the eighth edition continues to build transferable problem-solving skills. It includes a set of features such as Analyzing-Multiple-Concept Problems, Check Your Understanding, Concepts & Calculations, and Concepts at a Glance. This helps the reader to first identify the physics concepts, then associate the appropriate mathematical equations, and finally to work out an algebraic solution.

Al-Isharat wal-Tanbihat (Remarks and Admonitions) is one of the most mature and comprehensive philosophical works by Ibn Sina (Avicenna, 980–1037). Grounded in an exploration of logic (which Ibn Sina described as the gate to knowledge) and happiness (the ultimate human goal), the text illuminates the divine, the human being, and the nature of things through a wide-ranging discussion of topics. The sections of Physics and Metaphysics deal with the nature of bodies and souls as well as existence, creation, and knowledge. Especially important are Ibn Sina's views of God's knowledge of particulars, which generated much controversy in medieval Islamic and Christian philosophical and theological circles and provoked a strong rejection by eleventh-century philosopher al-Ghazali. This book provides the first annotated English translation of Physics and Metaphysics and edits the original Arabic text on which the translation is based. It begins with a detailed analysis of the text, followed by a translation of the three classes or groups of ideas in the Physics (On the Substance of Bodies, On the Directions and Their Primary and Secondary Bodies, and On the Terrestrial and Celestial Souls) and the four in the Metaphysics (On Existence and Its Causes, Creation Ex Nihilo and Immediate Creation, On Ends, on Their Principles, and on the Arrangement [of Existence], and On Abstraction. The Metaphysics closes with a significant discussion of the concepts of providence, good, and evil, which Ibn Sina uses to introduce a theodicy. Researchers, faculty, and students in philosophy, theology, religion, and intellectual history will find in this work a useful and necessary source for understanding Ibn Sina's philosophical thought and, more generally, the medieval Islamic and Christian study of nature, the world beyond, psychology, God, and the concept of evil.
