Fred Van Dyke's new textbook, Conservation Biology: Foundations, Concepts, Applications, 2nd Edition, represents a major new text for anyone interested in conservation. Drawing on his vast experience, Van Dyke's organizational clarity and readable style make this book an invaluable resource for students in conservation around the globe. Presenting key information and well-selected examples, this student-friendly volume carefully integrates the science of conservation biology with its implications for ethics, law, policy and economics.

With over 8500 entries, this informative dictionary addresses the social, legal, political and economic aspects of the environment and conservation as well as the scientific terms.

Biodiversity has become a buzzword in the environmental movement and in science, and is increasingly being taught in university degree courses. This new text is designed as a primer, giving non-specialists an introduction to the historical context, current debates, and ongoing research in this subject.

The threatened species categories used in Red Data Books and Red Lists have been in place for almost 30 years. The IUCN Red List Categories and Criteria provide an easily and widely understood system for classifying species at high risk of global extinction, so as to focus attention on conservation measures designed to protect them. This latest version of the classification system was adopted by the IUCN Council in February 2001 and reflects comments from the IUCN and SSC memberships and the final meeting of the Criteria Review Working Group.

Prevention, Recycling & Conservation initiatives are explored in a way that makes them easier for students to understand. What is conservation, what are natural, renewable and non-renewable resources? We also look at methods used to reduce the landfill waste by composting along with how organic materials are broken down. Written to grade and using simplified language and vocabulary we discover prevention methods for waste and pollution contaminating fresh water resources along with prevention initiatives caused by burning fossil fuels which pollute the atmosphere causing smog, depleted ozone and greenhouse gases. As well we introduce alternative fuels, zero waste goals and sustainable living methods. Our resource is comprised of ready-to-use reading passages, student activities, test prep, and color mini posters for remedial students. All of our content is aligned to your State Standards and are written to Bloom's Taxonomy.

This book explores the opportunities and challenges associated with the legal protection of World Heritage sites in the Pacific Islands. It argues that the small Pacific representation on the World Heritage List is in part due to a lack of strong legal frameworks for heritage conservation, putting such sites under threat. Providing a comprehensive analysis of the nomination, listing and protection of the Solomon Island World Heritage Site, it examines the implementation of the World Heritage Convention in the Pacific context. It explores how the international community's broadening interpretation of the notion of "outstanding universal value" has increased the potential for Pacific heritage to be classified as "World Heritage!". This book also analyses the protection regime established by the Convention, and the World Heritage Committee's approach to heritage conservation, identifying challenges associated with the protection of Pacific Island heritage.

This book demonstrates that trade-offs can be very important for conservationists. Its various chapters show how and why trade-offs are made, and why conservationists need to think very hard about what, if anything, to do about them. The book argues that conservationists must carefully weigh up, and be explicit about, the trade-offs that they make every day in deciding what to save. Key Features: Discusses the wider non-biological issues that surround making decisions about which species and biogeographic areas to prioritise for conservation Focuses on questions such as: What are these wider issues that are influencing the decisions we make? What factors need to be included in our assessment of trade-offs? What package of information and issues do managers need to consider in making a rational decision? Who should make such decisions? Part of the Conservation Science and Practice book series This volume is of interest to policy-makers, researchers, practitioners and postgraduate students who are concerned about making decisions that include recognition of trade-offs in conservation planning.

This book traces the policy history of urban conservation and its relationship to the town planning process and both are set in their political context. Part One deals with the origins of conservation and its cultural background. Part Two deals with the post-war legislation and the increasing scope of conservation. Part Three deals with churches and their separate control system, and Part Four brings the story up to the present time. New issues such as sustainable conservation and the latest government policy are addressed in the conclusion. This book will aid current practice and help to inform future directions.
