During the last couple of versions of Db2 for z/OS, and through the maintenance stream, new features and enhancements have been delivered to further improve the performance and functionality of the Db2 utilities. DB2® packages were

introduced with DB2  
V2.3 in 1993. During the  
15 years that have  
elapsed, a lot has  
changed. In particular,  
there is a more  
widespread use of  
distributed computing,  
Java™ language, new  
tools, and upgrades in  
the platform software and  
hardware. The best  
practices back then just

today. In this IBM® Redbooks® publication, we take a fresh look at bringing packages into the 21st century. We begin with an overview of packages and explain the advantages of using packages. Because database request module (DBRM) based plans have been deprecated in DB2 9, you need to convert to packages if

you did not use packages

already. We provide guidance on using a DB2 provided function to convert from DBRM-based plans to packages.

We re-examine the application development frameworks for packages: program preparation, package setup, and execution. For distributed applications, we include a discussion

of a utility to identify and remove deprecated private protocol and converting to DRDA® as well as an introduction to the new pureQuery function of Data Studio. We also discuss common problems and their resolutions. We then explore administration and operational activities dealing with packages, including security, access
