Zero comes quickly if we integrate

$\cos mx dx = \sin mx \quad m \pi \quad 0 = 0 - 0.$

So we use this: Product of sines $\sin nx \sin kx = \frac{1}{2}$

$\cos(n-k)x - \frac{1}{2} \cos(n+k)x.$

(4) Integrating $\cos mx$ with $m = n-k$ and $m = n+k$ proves orthogonality of the sines.

The exception is when $n = k.$

Then we are integrating

$$\int_0^{\pi} (\sin kx)^2 dx = \int_0^{\pi} \frac{1 - \cos 2kx}{2} dx = \frac{1}{2} \left[x - \frac{\sin 2kx}{2k} \right]_0^{\pi} = \frac{\pi}{2}$$

This book is intended to serve as introductory and reference material for the application of integral transforms to a range of common mathematical

omitted--in not a few cases after a preliminary draft was written--because I v believe that their inclusion would make the book too long.
