A great deal of physics has to do with making measurements – that’s the way all physics gets started. For that reason, physics uses a number of measurement systems, such as the CGS (centimeter-gram-second) system and the MKS (meter-kilogram-second) system. You also use the standard English system of inches and feet and so on – [...]

When making measurements, it is important to be as accurate and precise as possible. Accuracy is a measure of how close an experimental measurement is to the true, accepted value. Precision refers to how close repeated measurements (using the same device) are to each other.

In both of the above equations the chain rule of Calculus is used and by assumption x is a function of time. Therefore, x can be differentiated with respect to time. Now, evaluate the second derivative at $t = 0$. We have, $d^2x/dt^2 = -R (dx/dt)^2$.
