Standard Costing Overview. Standard costing is the practice of substituting an expected cost for an actual cost in the accounting records. Subsequently, variances are recorded to show the difference between the expected and actual costs. This approach represents a simplified alternative to cost layering systems, such as the FIFO and LIFO methods, where large amounts of historical cost information must be maintained for inventory items held in stock.

Research paper from the year 2011 in the subject Business economics - Accounting and Taxes, grade: 63%, University of Sunderland, course: Management Accounting and Control, language: English, abstract: This report is divided into two parts. The first part will explain how a standard costing system works and how a variance analysis is used properly. Furthermore, the statement "Standard Costing and Variance Analysis are appropriate to any type and size of organisation" will be critically evaluated. The second part determines factors, which must be considered in the decision-making process. In addition, four scenarios of decisions will be provided and analysed. One of the main objectives of an organisation is to minimise the cost of production and to control the costs as they are limited resources within a business (Gupta, 2010). Management accounting literature provides several tools in order to achieve these objectives. In this context, the system for collecting and reporting revenue and cost information by areas of responsibility is called responsibility accounting (Siegel & Shim, 2006). It is based on the assumption that managers should be held responsible for their performance. A well-designed responsibility accounting system integrates responsibility centers within the organisation. In addition, responsibility centers are units within the organization, which have control over costs and revenues (Siegel & Shim, 2006). There are different types of responsibility centers such as profit centers, investment centers, revenue centers and cost centers. In the following report, the focus is on cost centers. Here, a variance analysis based on standard costing is a performance measure of a cost center (Siegel & Shim, 2006). In addition, a standard costing system is a useful tool facilitating decision-making.

The calculation and interpretation of the full range of cost accounting variances is covered, together with the formal analysis of the decision to investigate variances. The way in which standard costing information is recorded in the accounts is also dealt with in depth, as this step is essential to a full appreciation of the role of standard costing. Finally, the usefulness of traditional standard costing techniques in a modern production environment is assessed.
