Extracts from mathematics textbook.

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum

of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.

Real-time strategies for real-life results! Are you struggling to balance your students' learning needs with their learning styles? William Bender's new edition of this teacher favorite is like no other. His is the only book that takes differentiated math instruction well into the twenty-first century, successfully blending the best of what technology has to offer with guidelines for meeting the objectives set forth by the Common Core. Every innovation in math instruction is addressed: Flipping math instruction Project-based learning Using Khan Academy in the classroom Educational gaming Teaching for deeper conceptual understanding
