The book encompasses Dr Baranski's 20 year experience in the field of abdominal organ donation. It is a step-by-step guide with photographs and drawings with clear explanations highlighting pitfalls. The book quickly and easily guides the reader through the difficult steps during organ procurement. It is mainly illustration-based, without much text, and covers surgical technical mistakes and organ damage.

Advances in the science of immunology have improved the success rate of organ transplantations since the mid twentieth century. Organ transplantation is now a lifesaving medical procedure for thousands of patients around the world with end-organ diseases. The lifesaving potential of transplantation has been limited by the number and quality of appropriate organ donors. The evolution of brain death criteria by the Harvard Ad-Hoc Committee Report has opened the door to understanding the importance of medical, legal and ethical challenges of organ donation in support of the growth of the transplant science. The possibility of organ donation from living donors has enhanced organ availability for patients with kidney failure. Modern inotropes and immunosuppression regimens have been critical to the success of other organ transplant procedures. However, the cornerstone of successful transplantation continues to be the appropriate selection, evaluation, preservation of organ tissues and the successful surgical procurement process to mitigate the impact of tissue ischemia and reperfusion. In this textbook, the art and science of organ donation and tissue preservation is examined. Through this authoritative text by leaders in the field, the editors provide a state of the art review of modern preservation techniques, patient selection and screening criteria, as well as best practices for multi-organ procurement. Information presented in the book will familiarize readers with the initial steps of determining organ availability which ultimately enables health care professionals to realize the extraordinary potential of successful multi-organ transplant procedures. This guide is intended to be a fundamental resource for students, residents, faculty and staff for all disciplines allied to health care delivery and organ donation.

One of the most interesting and at the same time most challenging fields of medicine and surgery has been that of organ donation and transplantation. It is a field that has made tremendous strides during the last few decades through the combined input and efforts of scientists from various specialties. What started as a dream of pioneers has become a reality for the thousands of our patients whose lives can now be saved and improved. However, at the same time, the challenges remain significant and so do the expectations. This book will be a collection of chapters describing these same challenges involved including the ethical, legal, and medical issues in organ donation and the technical and immunological problems the experts are facing involved in the care of these patients. The authors of this book represent a team of true global experts on the topic. In addition to the knowledge shared, the authors provide their personal clinical experience on a variety of different aspects of organ donation and transplantation.

This practical guide provides a full but concise account of the organ donation and transplantation process, from the management of the donor and organ preservation to perioperative management and surgical techniques. Readers will learn about various aspects of multi-organ retrieval such as different types of donors and evaluation of organ donors, as well as the retrieval process itself and ethical aspects of transplantation. Written in a consistent format, each of the themed parts examines the different types of solid organ transplantation, namely kidney, pancreas and liver. Each part discusses the indications for transplantation, organ allocation, surgical technique, post-operative management outcomes and professional skills for the surgeon. This is an essential guide for the transplant surgeon offering a unique summary of the critical issues in abdominal organ transplantation.

This book brings together knowledge from different fields of science and presents advances in organ transplantation and donation. It uses a multidisciplinary approach to examine the complex issues of the transplant process. Written by experts in the field, this volume is suitable for medical specialists and medical students alike.

Organ procurement is an essential step for organ transplantation, from which a quality organ is received for subsequent transplantation. As the demand for organ transplantation continues to grow, multi-organ donation including the heart, lung, liver, pancreas, kidneys, and small intestine from one potential donor is always a priority to meet the demand. The donor is generally rigorously assessed for suitability of organ donation prior to proceeding to organ procurement. The quality of the organ from multi-organ procurement is usually satisfactory without jeopardizing its transplantation. In this chapter, the surgical technique for procurement of the organs from the abdomen is described. Some alternative techniques have also been discussed. Some pictures are inserted to facilitate understanding of the surgical procedure.

Over the last few years, transplantation knowledge and techniques, as well as insights into pharmacology, have improved, thus enabling greater access to transplantation for patients. The pool of organs for transplantation is stable, and therefore insufficient to cope with the growing demand. To adjust demand and resources in the most equitable way, organ procurement and allocation have been organized nationally and often across borders. The national and international organ exchange programs were studied and discussed during the Congress on Organ Allocation, from which this book is derived. This book describes the state of the art in the management of waiting lists and the allocation of organs in transplantation. It includes chapters on the possibilities of expanding the pool of available cadaver organs. It also analyzes the results of transplantation of cadaver organs from older donors and marginal, non-heart beating donors. Transplantation policies based on the offering of organs by living donors are also described, as is the impact of delayed graft function on organ allocation.
