After finishing these pages you will have a complete database app designed using the visual development tool integrated into Visual Studio. The version utilized for designing this app was Visual Studio 2010 Professional. You may choose to use an Express version of Visual Studio which is available for free download from Microsoft. The target browser could be any current version of Internet Explorer, Firefox, Chrome, and even Safari. We will skip over the general process of creating a project in Visual Studio because that process should be considered generic across versions. The language used is C#. Using the Javascript/CSS approach detailed in this eBook, you can create as many layout variations (mobile, tablet, desktop) as your imagination can provide. This would include resizing of screen elements, fonts, buttons, and any other modifications which can provide a more user-friendly experience in your app. The resulting app will have the purpose of tracking mileage along the Appalachian Trail starting in GA and ending in ME. The app will include registration and login screens so that the users can manage their own profiles. The database "side of the house" consists of three main tables - users, individual mileage tracking and locations along the AT. Many of these locations include an accompanying picture. The mileage, pictures and longitude/latitude/altitude were downloaded from the web and combined into a single sheet. In order to enable web access to the database you will need a web host which provides MySQL databases. Detailed coverage of MySQL, MSSQL, and the general SQL command structure is beyond the scope of this eBook. In addition to the "play by play" in the code explanations, we will have a brief coverage of the MySQL statements utilized in this app in addition to the equivalent language that would be used for a Microsoft SQL server in a later chapter.

This book was written to help anyone want to get started with Azure Database for MySQL. It describes the basic elements of Azure Database for MySQL operations and shows you how to develop programs with database on Azure Database for MySQL. You will learn: \* Setting up Azure Database for MySQL \* Administering Azure Database for MySQL \* Developing Applications for Azure Database for MySQL \* Developing Azure App Service with Azure Database for MySQL

In chapter one, you will learn to know the properties and events of each control in a Windows Visual C# application. You need to learn and know in order to be more familiar when applying them to some applications in this book. In chapter two, you will go through step by step to build a SALES database using MySQL. You will build each table and add associated data fields (along with the necessary keys and indexes). The first field in the Client table is ClientID. Enter the client ID in the Name Field and select AutoNumber in the Data Type. You define primary key and other indexes which are useful for quick searching. ClientID is a primary field. You will define FamilyName as an index. You then will create Ordering table with three fields: OrderID, ClientID, and OrderDate. You then will create Purchase table with three fields: OrderID, ProductID, and Quantity. And you will create Product table with four fields: ProductID, Description, Price, and QtySold. Before designing Visual C# interface, you will build the relationships between four tables. The interface will be used to enter new orders into the database. The order form will be used to enter the following information into the database: order ID, order date, client ID, client's first name and family name, client's address, product information ordered. The form will have the ability to add new orders, find clients, add new clients. The completed order invoice will be provided in a printed report. In chapter three, you will build a database management system where you can store information about valuables in your warehouse. The table will have seven fields: Item (description of the item), Location (where the item was placed), Shop (where the item was purchased), DatePurchased (when the item was purchased), Cost (how much the item cost), SerialNumber (serial number of the item), PhotoFile (path of the photo file of the item), and Fragile (indicates whether a particular item is fragile or not) The development of this Warehouse Inventory Project will be performed, as usual, in a step-by-step manner. You will first create the database. Furthermore, the interface will be built so that the user can view, edit, add, or add data records from the database. Finally, you add code to create a printable list of information from the database. In chapter four, you will build an application that can be used to track daily high and low pollutant PM2.5 and air quality level. The steps that need to be taken in building Siantar Air Quality Index (SAQI) database project are: Build and test a Visual C# interface, Create an empty database using code, and Report database. The designed interface will allow the user to enter max pollutant, min pollutant, and air quality for any date that the user chooses in a particular year. This information will be stored in a database. Graphical result of the data will be provided, along with summary information relating to the maximum value, minimum value, and mean value. You will use a tab control as the main component of the interface. The control has three tabs: one for viewing and editing data, one for viewing graph of pollutant data, and another for viewing graph of air quality data. Each tab on this control operates like a Visual C# control panel. In chapter five, you will perform the steps necessary to build a MySQL book inventory database that contains 4 tables. You will build each table and add the associated fields as needed. You will have four tables in the database and define the relationship between the primary key and foreign key. You will associate AuthorID (foreign key) field in the Title\_Author table with AuthorID (primary key) in the Author table. Then, you want to associate the ISBN (foreign key) field in Title\_Author table with ISBN (primary key) in the Title table.

An updated guide to database programming with Visual Basic .NET explains how to create databases, tables, database projects, constraints, and other elements from within the Visual Studio .NET IDE, with additional guidelines for creating a complete user management system incorporating SQL Server (or Microsoft Access), Active Directory, and MessageQueue. The Complete Reference to Professional SOA with Visual Studio 2005 (C# & VB 2005) focuses on architecting and constructing enterprise-level systems. Taking advantage of the newly released Visual Studio 2005 development environment, the book assesses the current service-oriented platform and examines new ways to develop for scalability, availability, and security (which have become available with .NET 2.0). You'll get to look closely at application infrastructure in terms of flexibility, interoperability, and integration, as well as the decisions that have to be made to achieve optimum balance within your architecture.

MySQL remains one of the hottest open source database technologies. As the database has evolved into a product competitive with proprietary counterparts like Oracle and IBM DB2, MySQL has found favor with large scale corporate users who require high-powered features and performance. Expert MySQL is the first book to delve deep into the MySQL architecture, showing users how to make the most of the database through creation of custom storage handlers, optimization of MySQL's query execution, and use of the embedded server product. This book will interest users deploying MySQL in high-traffic environments and in situations requiring minimal resource allocation.

Many professionals and students in engineering, science, business, and other application fields need to develop Windows-based and web-enabled information systems to store and use data for decision support, without help from professional programmers. However, few books are available to train professionals and students who are not professional programmers to develop these information systems. Developing Windows-Based and Web-Enabled Information Systems fills this gap, providing a self-contained, easy-to-understand, and well-illustrated text that explores current concepts, methods, and software tools for developing Windows-based and web-enabled information systems. Written in an easily accessible style, the book details current concepts, methods, and software tools for Windows-based and web-enabled information systems that store and use data. It is self-contained with easy-to-understand small examples to walk through concepts and implementation details along with large-scale case studies. The book describes data modeling methods including entity-relationship modeling, relational modeling and normalization, and object-oriented data modeling, to develop data models of a database. The author covers how to use software tools in the Microsoft application development environment, including Microsoft Access, MySQL, SQL, Visual Studio, Visual Basic, VBA, HTML, and XML, to implement databases and develop Windows-based and web-enabled applications with the database, graphical user interface, and program components. The book takes you through the entire process of developing a computer and network application for an information system, highlighting concepts and operation details. In each chapter, small data examples are used to manually walk through concepts and operational details. These features and more give you the conceptual understanding and practical skill required, even if you don't have a computer science background, to develop Windows-based or web-enabled applications for your specialized information system.

This book covers how to design a dynamic website integrated with admin panel step by step in Visual Studio 2019 using Asp.net c #, HTML, CSS, and MySQL database. The project that we will design is flexible and can be used for a variety of purposes, while the method of explaining the book is simple and academically, meaning that the book will be useful for university students and can be taken as a curriculum for lecturers.Our site is divided into two sections, the front-end section, and it is the section that will appear to visitors. The second section is the back-end section that visitors cannot view, only the site administrator can access it, and it is called the admin panel (or control panel) and through it we can control the site more flexibly where we can delete, add or edit posts in the chapter 1, we will deal with the programs and technologies that we will need in designing our project, from how to install Visual Studio, the xampp program, the technologies that we will need, in addition to how to create a project and so on. In the chapter 2, we will talk about the basics of the asp.net language, how to deal with its tools, and how to link to the database. Chapter 3 will talk to MySQL about how to create a database and create a tables, how to fill it with data, delete and modify, etc. Chapter 4 will talk about HTML, which is responsible for the structure of the site. While the chapter 5 talks about CSS and is responsible for the aesthetics of the site. While Chapter 6 talks about designing our project step by step.
