Plant anatomy and physiology and a broad understanding of basic plant processes are of primary importance to a basic understanding of plant science. These areas serve as the first important building blocks in a variety of fields of study, including botany, plant biology, and horticulture. Structure and Function of Plants will serve as a text aimed at undergraduates in the plant sciences that will provide an accurate overview of complex plant processes as well as details essential to a basic understanding of plant anatomy and physiology. Presented in an engaging style with full-color illustrations, Structure and Function of Plants will appeal to undergraduates, faculty, extension faculty, and members of Master Gardener programs.

\*This workbook lays the foundations for cell biology and the identification of living things. It also includes material on dichotomous keys, classification of plants and animals, structures and functions of plant parts, microscopes, respiration, photosynthesis, diffusion and osmosis. It focuses on aspects of levels 3, 4 and 5 of the New Zealand Science Curriculum. It gives students a solid foundation of cell biology, emphasising a few key organelles and their functions. It includes the skills needed to use a microscope effectively and gives the basics of drawing correctly from a microscope. With the information covered in this book, students will be prepared for the demands of Level 1 NCEA and beyond. The literacy tasks in this workbook encourage the students to read for meaning, scan material, select appropriate information and understand key words. The inclusion of mini-research projects prepares students for what is required in the Senior Sciences. The numeracy tasks involve number skills, rounding, graphing data and reading tables accurately. These are all vital skills in the Sciences and beyond\*--Preface.

The compartmentation of genetic information is a fundamental feature of the eukaryotic cell. The metabolic capacity of a eukaryotic (plant) cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus/cytosol, plastids, and mitochondria. Alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism. Although the biological significance of this genetic design has been vividly evident since the discovery of non-Mendelian inheritance by Baur and Correns at the beginning of this century, and became indisputable in principle after Renner's work on interspecific nuclear/plastid hybrids (summarized in his classical article in 1934), studies on the genetics of organelles have long suffered from the lack of respectability. Non-Mendelian inheritance was considered a research sideline-Ifnot a freak-by most geneticists, which becomes evident when one consults common textbooks. For instance, these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria, of metabolism and global circulation of the biological key elements C, N, and S, as well as of the organization, maintenance, and function of nuclear genetic information. In contrast, the heredity and molecular biology of organelles are generally treated as an adjunct, and neither goes as far as to describe the impact of the integrated genetic system.
