You can make the radio without this, but having a workspace and a place to mount the radio makes it easier to carry around while you're looking for a place to hook the ground wire. WHAT YOU'LL DO Step 1: Wind 26-gauge wire (the green magnet wire) around the glue stick until it covers nearly the entire cylinder.

When you mention Arduino radio, you always think of modern FM radio (88-108 MHz in Europe). The LW, MW and SW band cover the range from 0.2 to 30 MHz. SW is especially interesting. Radio waves in the shortwave band can be reflected or refracted from a layer of electrically charged atoms in the atmosphere called the ionosphere.

Ettus Research, the folks behind what has come to be regarded as the granddaddy of affordable wideband SDR hardware platforms: the USRP, have put together a video tutorial in which they demonstrate how you can create an FM receiver application in under 10 minutes. This is based on using GNU Radio and its excellent graphical tool, GNU Radio Companion (GRC).

Combine the Si4844-A10 analog-tuned radio receiver with an Arduino to make a full-featured multiband radio. The idea of a single chip radio is intriguing. The prospect is especially interesting to me because, frankly, I envy the analog skills I associate with building a radio receiver.

If you're a student or hobbyist who enjoys working with electronics, you'll love this project-packed book. It puts at your fingertips the hands-on guidance you need.

A DIY guide to designing and building transistor radios Create sophisticated transistor radios that are inexpensive yet highly efficient. Build Your Own Transistor Radios: A Hobbyist's Guide to High-Performance and Low-Powered Radio Circuits offers complete projects with detailed schematics and insights on how the radios were designed. Learn how to choose components, construct the different types of radios, and troubleshoot your work. Digging deeper, this practical resource shows you how to engineer innovative devices by experimenting with and radically improving existing designs. Build Your Own Transistor Radios covers: Calibration tools and test generators TRF, regenerative, and reflex radios Basic and advanced superheterodyne radios Coil-less and software-defined radios Transistor and differential-pair oscillators Filter and amplifier design techniques Sampling theory and sampling mixers In-phase, quadrature, and AM broadcast signals Resonant, detector, and AVC circuits Image rejection and noise analysis methods This is the perfect guide for electronics hobbyists and students who want to delve deeper into the topic of radio. Make Great Stuff! TAB, an imprint of McGraw-Hill Professional, is a leading publisher of DIY technology books for makers, hackers, and electronics hobbyists.

MORE THAN JUST SLIGHTLY EVIL: SAFE, INEXPENSIVE, EDUCATIONAL . . . AND FUN! 22 Radio and Receiver Projects for the Evil Genius features a unique collection of projects that teach you radio and electronics essentials such as the radio spectrum, how to read schematics, and how to solder. After each project is completed, you can enjoy listening to and using their new receiver.

Electronic projects for adults and children, you can: Build your own AM radio receiver Build your own FM radio receiver Build your own shortwave radio receiver Build an AM transmitter to have your own radio station Build three types of headphone amplifiers Build a stereo power amplifier based on the op-amp Create funky oscilloscope patterns Learn how to program computers Learn how to simulate an electronic circuit's operation without actually building it

Electronics basics as you work through the book.

This text, through digital experiments, aims to teach the reader practical electronics circuit theory and building techniques. Step-by-step instructions are used to teach techniques for component identification, soldering and troubleshooting.

Radio astronomy is far from being beyond the scope of amateurs astronomers, and this practical, self-contained guide for the newcomer to practical radio astronomy is an ideal introduction. This guide is a must for anyone who wants to join the growing ranks of 21st Century backyard radio astronomers. The first part of the book provides background material and explains (in a non-mathematical way) our present knowledge of the stronger radio sources | those observable by amateurs | including the Sun, Jupiter, Meteors, Galactic and extra-galactic sources. The second part of the book deals not only with observing, but | assuming no prior technical knowledge of electronics or radio theory | takes the reader step-by-step through the process of building and using a backyard radio telescope. There are complete, detailed plans and construction information for a number of amateur radio telescopes, the simplest of which can be put together and working | using only simple tools | in a weekend. For other instruments, there are full details of circuit-board layouts, components to use and (vitaly important in radio astronomy) how to construct antennae for radio astronomy.
