This new edition of  
Manufacturing Processes for  
Engineering Materials

continues its tradition of balanced and comprehensive coverage of relevant engineering fundamentals, mathematical analysis, and traditional as well as advanced applications of manufacturing processes and operations. Updated and thoroughly edited for improved readability and clarity, this book is written mainly for students in mechanical, industrial, and metallurgical and materials engineering programs. The text continually emphasizes the important interactions among a wide variety of technical disciplines and the economics of manufacturing

operations in an increasingly competitive global marketplace.

Provides undergraduates and practicing engineers with an understanding of the theory and applications behind the fundamental concepts of machine elements. This text includes examples and homework problems designed to test student understanding and build their skills in analysis and design.

comprehensive text, written mainly for students in mechanical, industrial, and metallurgical and materials engineering programs. The text, as well as the numerous examples and case studies in each chapter, clearly show that manufacturing engineering is a complex and interdisciplinary subject. The topics are organized and presented in such a manner that they motivate and challenge students to present technically and economically viable solutions to a wide variety of questions and problems, including product design. Since the publication of the

third edition, there have been rapid and significant advances in various areas in manufacturing. The fourth edition of Manufacturing Processes for Engineering Materials, while continuing with balanced coverage of the relevant fundamentals, analytical approaches, and applications, reflects these new advances. New in the Fourth Edition: \*A new Chapter 13 on fabrication of microelectronic and micromechanical devices. \*Expansion of design considerations in each chapter. r New examples and case studies throughout all chapters. \*A total of 1230 questions and problems; 32

A book for midwives who would like to explore how best to help women cope with pain and fear. This book contains information about the physiological and psychological functions of pain; cultural influences on the experience of labour pain; elective caesareans, which are supposedly a simpler alternative; advantages and drawbacks of using pharmacological pain relief; information and ideas on how to transform labour pain into an experience of strength and power. While the book provides information on a

very wide range of pain relief options and the emphasis is on maternal choice, it also presents many convincing arguments for normal physiological birth. It can therefore make a contribution to helping reduce the rate of unnecessary caesareans and help midwives improve rates of maternal satisfaction. Forewords by Dr Trudy Stevens and Dr Helene Vadeboncoeur.

improvement and emphasizing  
the hands-on use of tools  
furnished. The book  
introduces basic  
experimental design  
principles and avoids  
complicated statistical
