The assessment of fire damaged hot rolled structural steel is an area in which many engineers and architects have little practical experience. On many occasions fire affected steelwork shows little or no distortion resulting in considerable uncertainty regarding its re-usability. This is particularly true in situations where fire has resulted in some parts of the structure exhibiting little or no damage alongside areas where considerable damage and distortion are clearly visible.

Corrosion of reinforcement in concrete structures is a complex electrochemical process. Migration of moisture and aggressive chemicals through the porous cover concrete would cause corrosion of steel reinforcement.

CONDITION ASSESSMENT OF BUILDINGS

Particularly when deterioration or damage to the existing structure caused by salt damage, neutralization, freezing damage, alkali aggregate reaction, chemical concrete corrosion and fatigue has been confirmed through a primarily visual inspection, detailed reference materials regarding the deterioration of the structure can be obtained by performing a detailed inspection; see Chapter 4 "Inspections" in the Maintenance Guidelines (draft).

This book forms the proceedings of the International Workshop organised by the European Convention for Constructional Steelwork held in Timisoara, Romania, in June 1994. It presents the latest progress in theoretical and experimental research on the behaviour of steel structures in seismic areas, taking into account the basic problems of local and global ductility, codification, design and applications. It relates strongly to the activities on international codification taking place in Europe.

Technical Rescue Operations, Volume II: Common Emergencies is the second in a three-volume series by Larry Collins. Volume II covers responding to, managing, and conducting rescues in the "daily" setting of fire/rescue agencies. This includes the kind of technical rescues that confront firefighters and rescuers on practically a daily basis. This volume also explains how to handle more complex and large-scale rescue operations that challenge responders to apply solid rescue principals for longer periods of time, with the assistance required of additional resources and under more strict command and control because of the scope of the incident, its newsworthiness, crowds of people arriving on the scene, and getting the immediate attention of local or regional elected officials. Features & Benefits: Learn from the author's repeated "once in a career" incidents that are commonplace for busy fire/rescue units such as the L.A. County Fire Department's USAR task force/USAR Company Maximize the base of knowledge developed by leading international rescuers and fire/rescue agencies, taught by a current practitioner assigned as an officer of one of the most experienced and battle-hardened fire department rescue units in the nation Contains "best practices" from fire/rescue agencies from around the world, showing how technical rescues and disasters can be managed better, faster, and safer Technical Rescue Operations, Volume II: Common Emergencies is the second in a three-volume series by Larry Collins.
