The Thing. Daredevil. Captain Marvel. The Human Fly. Drawing on DC and Marvel comics from the 1950s to the 1990s and marshaling insights from three burgeoning fields of inquiry in the humanities/disability studies, death and dying studies, and comics studies|José Alaniz seeks to redefine the contemporary understanding of the superhero. Beginning in the Silver Age, the genre increasingly challenged and complicated its hypermasculine, quasi-eugenicist biases through such disabled figures as Ben Grimm/The Thing, Matt Murdock/Daredevil, and the Doom Patrol. Alaniz traces how the superhero became increasingly vulnerable, ill, and mortal in this era. He then proceeds to a reinterpretation of characters and series/some familiar (Superman), some obscure (She-Thing). These genre changes reflected a wider awareness of related body issues in the postwar United States as represented by hospice, death with dignity, and disability rights movements. The persistent highlighting of the body's (im)perfection) comes to forge a predominant aspect of the superherotic self. Such moves, originally part of the Silver Age strategy to stimulate sympathy, enhance psychological depth, and raise the dramatic stakes, developed further in such later series as The Human Fly, Strikeforce: Morituri, and the landmark graphic novel The Death of Captain Marvel, all examined in this volume. Death and disability, presumed routinely absent or denied in the superhero genre, emerge to form a core theme and defining function of the Silver Age and beyond.

We have been told that we were attacked by 19 Muslim fanatics on 9/11. This story works well for those who don't look carefully at it. But upon close inspection, this whole account crumbles to dust faster than the Twin Towers did. Find out the shocking truth about who really perpetrated this terrible crime, and why.

Mechanical laws of motion were applied very early for better understanding anthropomorphic action as suggested in advance by Newton «For from hence are easily deduced the forces of machines, which are compounded of wheels, pulleys, levers, cords, and weights, ascending directly or obliquely, and other mechanical powers; as also the force of the tendons to move the bones of animals». In the 19th century E.J. Marey and E. Muybridge introduced chronophotography to scientifically investigate animal and human movements. They opened the field of motion analysis by being the first scientists to correlate ground reaction forces with kinetics. Despite of the apparent simplicity of a given skilled movement, the organization of the underlying neuro-musculo-skeletal system remains unknown. A reason is the redundancy of the motor system: a given action can be realized by different muscle and joint activity patterns, and the same underlying activity may give rise to several movements. After the pioneering work of N. Bernstein in the 60's on the existence of motor synergies, numerous researchers «walking on the borders of their disciplines tend to discover laws and principles underlying the human motions and how the brain reduces the redundancy of the system. These synergies represent the fundamental building blocks composing complex movements. In robotics, researchers face the same redundancy and complexity challenges as the researchers in life sciences. This book gathers works of roboticists and researchers in biomechanics in order to promote an interdisciplinary research on anthropomorphic systems at large and on humanoid robotics in particular.

Fun and challenging activities help develop basic skills such as vocabulary, and build critical thinking and problem solving skills.
