Being deployed to a war zone can result in numerous adverse psychological health conditions. It is well documented in the literature that there are high rates of psychological disorders among military personnel serving in Operation Enduring Freedom in Afghanistan and Operation Iraqi Freedom in Iraq as well as among the service members' families. For service members' families, the degree of hardship and negative consequences rises with the amount of the service members' exposure to traumatic or life-altering experiences. Adult and child members of the families of service members who experience wartime deployments have been found to be at increased risk for symptoms of psychological disorders and to be more likely to use mental health services. In an effort to provide early recognition and early intervention that meet the psychological health needs of service members and their families, DOD currently screens for many of these conditions at numerous points during the military life cycle, and it is implementing structural interventions that support the improved integration of military line personnel, non-medical caregivers, and clinicians, such as RESPECT-Mil (Re-engineering Systems of Primary Care Treatment in the Military), embedded mental health providers, and the Patient-Centered Medical Home. Preventing Psychological Disorders in Service Members and Their Families evaluates risk and protective factors in military and family populations and suggests that prevention strategies are needed at multiple levels - individual, interpersonal, institutional, community, and societal - in order to address the influence that these factors have on psychological health. This report reviews and critiques reintegration programs and prevention strategies for PTSD, depression, recovery support, and prevention of substance abuse, suicide, and interpersonal violence.

With hundreds of different child health assessment instruments introduced in the past 25 years, how do you locate the ones that are appropriate for your needs? How do you select from among those you've located? And how can you be sure you haven't overlooked some little-known measures that may be just what you've been looking for? Until now, locating and selecting child health assessment instruments hasn't been easy. Or fast. Or (in many instances) accurate. And it's quite possible you've overlooked measures that would have been perfect for your needs, if only you had known about them. Researched and written by three psychologists specializing in children's health, Child Health Assessments is the only handbook of its kind. Part I describes the organization of the book, and provides highly-relevant information necessary for properly evaluating the psychometric characteristics of child health instruments. It also reviews the issues and guidelines regarding the selection of appropriate instruments. Part II contains reviews--based on published literature, with additional input from practitioners and researchers throughout the world--on more than 100 child health instruments. Each instrument is described in detail, with such standard information as: author name(s), instrument title and description, availability, samples for whom the measure is appropriate, sample items, scoring details, reliability and validity, and published references. The reviews are listed alphabetically and also according to child health domain: General and Illness-Specific Adjustment; Stress and Coping; Attitudes and Beliefs; Pediatric Pain and Childhood Injury; Quality of Life; Health-Related Knowledge and Adherence to Medical Regimens; Parent, Family, and Health Care Professional. Part III offers the authors' summary impressions, conclusions regarding the status of child health assessment, and recommendations for its continued advancement. For child health care professionals.

Conduct a thorough, patient-focused, health assessment...every time. This practical, real-world approach provides all of the how-tos, what-tos, when-tos, and why-tos you need to master the art and science of assessment in a well-organized, well-illustrated text that makes the material easier to learn now and reference later. The book simplifies the approach to assessment in two ways. First, it focuses on the normal and the normal variants of the adult, child, elderly, and pregnant patients that you'll see most frequently in practice. Then, when a finding falls outside of those parameters, you'll be able to identify it as abnormal. Second, assessment is presented as a linear and consistent process; so you are able to undertake the same steps in the same order to ensure that you don't miss anything. An access code inside new printed texts unlocks your DavisPlus Premium online resources, including your Davis Digital eBook, the complete text online, for study anytime, anywhere, and a wealth of learning tools and references. See what people are saying... "Must have text for Nursing Health Assessment class. Well written, easy to read, great online resources for faculty. Excellent resource for clinical setting." - Kimberly F. "This book is an excellent resource for all nursing students with an easy to use format. Nursing faculty will find that this book provides excellent quiz questions, supportive materials, and resources. A must for nursing students in health assessment courses and in clinical settings!" - Amazon Reviews "This is a must! Excellent assessment text for health care providers. It has great tips and is an easy read. I would highly recommend it." - Rose L. "Essential Health Assessment is a remarkably new way to structure and improve health assessment teaching for nursing students. The book is uniquely structured, with outstanding and novel features. It is packed with highly useful real-life illustrations and images, and the layout is beautiful, with excellent use of color coding, similar organization from chapter to chapter, boxes and tables. Unique features include appropriate cultural care, veteran care, holistic concepts such as CLEAR communication, spiritual assessment, and Safe Effective Nursing Care (SENC). Additional notable distinctions are several chapters of high quality content on special populations, including pediatrics, separated into newborn and child/adolescent chapters, as well as a chapter each on assessment of the pregnant woman and of the older adult. It is unusual for health assessment textbooks to offer this level of detail on special populations, and it is a welcome and needed addition. Nursing students, working nurses and faculty alike, should all find this new textbook a unique and ideal resource for learning and practicing health assessment." - Mary A. Helming PhD, APRN, FNP-BC, AHN-BC Professor of Nursing, Quinnipiac University School of Nursing Hamden, CT

This issue is devoted to patient reported outcomes and their impact in the study of rheumatic diseases and the authors will also discuss PROs and vulnerable populations with rheumatic disease; technology, electronic health records and PROs; past, present and future; the promise of PROMIS - a uniform approach to PROs across rheumatic diseases, quality measures and PROs and how they relate and the importance of PROs in delivering quality care in the rheumatic diseases, and many more exciting articles.

INTRODUCTION: College represents a major stepping stone toward independence for a number of students. This transition from high school to college life is a critical period for development of a healthy lifestyle. Health promotion departments at universities are uniquely positioned to implement a comprehensive strategy for increasing physical activity, and advocate for healthful eating. The Kansas State University (KSU) Health Promotion team at Lafene Health Center helps students enhance their health behaviors, and they developed a questionnaire to better understand the health issues students face. Their questionnaire, The Health Assessment Needs of Kansas State Students (THANKS), was created to better understand the barriers to a healthful lifestyle for students at KSU. The purpose of the current study was to assess the THANKS (questionnaire)used in the Fall 2016 and Fall 2017 semesters within the student population at KSU. METHODS: The Fall 2016 and Fall 2017 THANKS questionnaires were analyzed for this investigation. The THANKS questionnaires focused on holistic aspects of health, including: physical activity, hydration, nutrition, tobacco use, mental health, social determinants of health, general health, and demographics. For the purpose of assessing this questionnaire, section A: Physical Activity (PA), section B: Nutrition, and section H: Demographics were analyzed. The following analyses were performed: readability analysis; the Flesch Reading Ease Score and Flesch Kincaid Grade Level score, descriptive statistics, reliability analysis; Cronbach's Alpha and Cronbach's Alpha if item deleted, and ANOVA. RESULTS: Overall, women made up the majority of the sample size (66.7%). Age ranges for 18 yrs old for all academic classifications were 72.3% (freshman) and 3.4% (sophomore). 19-24 yrs old age category had 93.3% (sophomore), 92.6% (Junior), 87.1% (Senior), whereas, graduate or professional students had 39.8% as their highest for the category of 25 to 30 yr olds. The majority of freshman resided in campus residence halls (75.3%), whereas for all classes respectively resided off campus (52.1%, 71.6%, 83.1%, 83%). The sample was primarily Caucasian for all classes (sophomore- graduate or professional), respectively (83.4%, 83.2%, 85.8%, 87.6%, 65.9%). Reliability analysis showed a low Cronbach's Alpha for the PA section (0.58). For the nutrition section, frequency questions (0.61), and location of meals consumed had a high a high reliability (0.89). Flesch Reading Ease score of 70.3 indicated the THANKS survey is fairly easy to read. Flesch-Kincaid Grade Level score of 5.2 indicated the reader's age of fifth graders. All inter-item correlations for the frequency of PA and location of engagement in PA were below 0.15. ANOVA of general nutritious diet and consumption of p-values of SSB (0.001), energy drinks (0.019), meals at home (0.007), meals off campus (0.000), meals at vending machine (0.031), glasses of water (0.001), participation in PA (0.000), frequency of moderate intensity (0.002), frequency of strength/resistance training (0.000) per week showed significance. ANOVA for participation in PA and of p-values SSB (0.001) per week and glasses of water per week (0.000) showed significance. CONCLUSION: The THANKS survey shows promise for an adequate survey tool but with room for improvement. Health promotion department may need to improve the psychometric properties of the PA and nutrition sections of the survey in order to obtain meaningful survey results that may be used in translation to programming for improved health on campuses.
