Examines the works of statistics pioneer Ronald Fisher as well as other revolutionary thinkers in the field, covering the rise and fall of Karl Pearson's theories, the methods that contributed to Japan's post-war rebuilding, a pivotal early study on a Guinness beer cask, and more. Reprint. 15,000 first printing.

At a summer tea party in Cambridge, England, a lady states that tea poured into milk tastes differently than that of milk poured into tea. Her notion is shouted down by the scientific minds of the group. But one guest, by the name Ronald Aylmer Fisher, proposes to scientifically test the lady's hypothesis. There was no better person to conduct such a test. For Fisher had brought to the field of statistics an emphasis on controlling the methods for obtaining data and the importance of interpretation. He knew that how the data was gathered and applied was as important as the data themselves. In *The Lady Tasting Tea*, readers will encounter not only Ronald Fisher's theories (and their repercussions), but the ideas of dozens of men and women whose revolutionary work affects our everyday lives. Writing with verve and wit, author David Salsburg traces the rise and fall of Karl Pearson's theories, explores W. Edwards Deming's statistical methods of quality control (which rebuilt postwar Japan's economy), and relates the story of Stella Cunliff's early work on the capacity of small beer casks at the Guinness brewing factory. *The Lady Tasting Tea* is not a book of dry facts and figures, but the history of great individuals who dared to look at the world in a new way.

Discusses how statistics have changed the field of science in the twentieth century, focusing on the theories and ideas of famous scientists and thinkers.

In this illuminating volume, Robert P. Abelson delves into the too-often dismissed problems of interpreting quantitative data and then presenting them in the context of a coherent story about one's research. Unlike too many books on statistics, this is a remarkably engaging read, filled with fascinating real-life (and real-research) examples rather than with recipes for analysis. It will be of true interest and lasting value to beginning graduate students and seasoned researchers alike. The focus of the book is that the purpose of statistics is to organize a useful argument from quantitative evidence, using a form of principled rhetoric. Five criteria, described by the acronym MAGIC (magnitude, articulation, generality, interestingness, and credibility) are proposed as crucial features of a persuasive, principled argument. Particular statistical methods are discussed, with minimum use of formulas and heavy data sets. The

ideas throughout the book revolve around elementary probability theory, t tests, and simple issues of research design. It is therefore assumed that the reader has already had some access to elementary statistics. Many examples are included to explain the connection of statistics to substantive claims about real phenomena.

A NEW YORK TIMES BOOK OF THE YEAR Henrietta Lovell is best known as 'The Rare Tea Lady'. She is on a mission to revolutionise the way we drink tea by replacing industrially produced teabags with the highest quality tea leaves. Her quest has seen her travel to the Shire Highlands of Malawi, across the foothills of the Himalayas, and to hidden gardens in the Wuyi-Shan to source the world's most extraordinary teas. *Infused* invites us to discover these remarkable places, introducing us to the individual growers and household name chefs Lovell has met along the way - and reveals the true pleasures of tea. The result is a delicious infusion of travel writing, memoir, recipes, and glorious photography, all written with Lovell's unique charm and wit.

Detailing the history of probability, this book examines the classic problems of probability that have shaped the field and emphasizes problems that are counter-intuitive by nature. *Classic Problems of Probability* is rich in the history of probability while keeping the explanations and discussions as accessible as possible.

This lively collection of essays examines statistical ideas with an ironic eye for their essence and what their history can tell us for current disputes. The topics range from 17th-century medicine and the circulation of blood, to the cause of the Great Depression, to the determinations of the shape of the Earth and the speed of light.

Developed from celebrated Harvard statistics lectures, *Introduction to Probability* provides essential language and tools for understanding statistics, randomness, and uncertainty. The book explores a wide variety of applications and examples, ranging from coincidences and paradoxes to Google PageRank and Markov chain Monte Carlo (MCMC). Additional
