Mental Status Examination. Department of Psychiatry and Behavioral Sciences. The Mental Status Exam is analogous to the physical exam: it is a series of observations and examinations at one point in time. Focused questions and observations can reveal "normal" or pathological findings. Although our observations occur in the context of an interview and may therefore be ordered differently for each patient, the report of our findings is ordered and "paints a picture" of a patient's appearance, ...

Developed from years of teaching psychiatry to medical students and residents, this comprehensive text devoted solely to describing the mental status examination (MSE) fills a void in the teaching literature and will be valuable to both students first learning about the MSE and seasoned clinicians seeking an informative reference. The introductory chapter offers basic advice on interviewing patients and eliciting information. Six major sections of the MSE follow and are thoroughly described with a chapter devoted to each: Appearance, Attitude, Activity; Mood and Affect; Speech and Language; Thought Content, Thought Process, and Perception; Cognition; and Insight and Judgment. Each chapter lists a detailed definition of reference for students describing their findings, and are an insightful review even for experienced practitioners. The clinical relevance of mental status abnormalities is illustrated through frequent examples of disorders that can cause the particular signs and symptoms defined in each chapter. A final chapter describing fictional case histories with hypothetical examples of written mental status reports will be particularly useful for those learning to write such reports. This text is an important addition to the libraries of students and practitioners who work with psychiatric patients and should help to simplify and organize a challenging task.

Status Examination is an interactive workbook containing case studies, activities, and study questions to guide students through the process of administering the examination and documenting the information. Each chapter explores a distinct aspect of the assessment, allowing readers to focus on key areas of interest. Students will learn how to assess for potential psychopathology, psychosis, and suicidal or homicidal ideation, and will examine unique cultural and age considerations that may affect individual experiences. Well-suited to a wide range of disciplines, including health, nursing, social work, and occupational therapy, this workbook's practical approach and rich pedagogical content make it an ideal resource for new and aspiring practitioners in these fields.

Since the publication of the Institute of Medicine (IOM) report *Clinical Practice Guidelines We Can Trust* in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also

rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.
