The science of love states that attraction is another crucial component of love and is different from, yet related to lust. Dr. Fisher believes, "Your biology plays a role," when it comes to attraction. Although we may get attracted to someone we lust for and vice versa, both lust and attraction can occur independently.

The Science Of Love: Lust, Attraction, Attachment & Brain ...

Being in love is affected by huge, measurable changes in the biochemistry of the brain. Science has identified three basic parts of love, each driven by a unique blend of brain chemicals. Lust is governed by both estrogen and testosterone, in both men and women. Attraction is driven by adrenaline, dopamine, and serotonin—the same chemicals that are released by exciting, novel experiences.

The rush we get when we first fall in love activates regions of the brain linked with drive, craving, and obsession, and shuts down those responsible for decision-making and planning ahead, says Helen Fisher, PhD, biological anthropologist and Senior Research Fellow at The Kinsey Institute.

The Science of Staying in Love - Mindful

Self-love is a concept flooding feeds and conversations more and more. This is not without reason. For generations—if not for all of humanity—we have ignored low self-esteem and self-hate. Now self-love science is here to show us just how important accepting yourself really is.

A brilliant and sparkling exploration of the extraordinary nature of romantic love - from the frontline of cutting-edge scientific research.

Internationally respected neuroscientist Dr. Gologlu takes us on a scientific journey through who, how, and why we love, and provides illuminating explanations to all love-related questions in an easy and relatable style. Based on hundreds of exclusive scientific studies, this well-researched book offers the neuroscience insights you need to improve your dating life and romantic relationships. In this comprehensive practical guide you'll find: * How do our brain and hormones change when we fall in and out of love? * What are the features that make someone attractive, and why? * How do toxic partners manipulate the love circuit in our brains? * And so much more! For anyone who has ever struggled with finding love, or anyone who is merely interested in the scientific mechanics behind attraction and affection, this is a must-read piece. This book also gives plenty of tips and advice regarding how to attract the perfect partner, establishing healthy boundaries, and leading a happy life by being happy within your relationships. The Science of Love and Attraction is a wonderful learning tool aimed at anyone who has ever been curious as to how love works. So if you've been unlucky in love, or just want to expand your knowledge, add this incredible book to your collection today and get smart about love!

Who do we love? Who loves us? And why? Is love really a mystery, or can neuroscience offer some answers to these age-old questions? In her third enthralling book about the brain, Judith Horstman takes us on a lively tour of our most important sex and love organ and the whole smorgasbord of our many kinds of love—from the bonding of parent and child to the passion of erotic love, the affectionate love of companionship, the role of animals in our lives, and the love of God. Drawing on the latest neuroscience, she explores why and how we are born to love—how we're hardwired to crave the companionship of others, and how very badly things can go without love. Among the findings: parental love makes our brain bigger, sex and orgasm make it healthier, social isolation makes it miserable—and although the craving for romantic love can be described as an addiction, friendship may actually be the most important loving relationship of your life. Based on recent studies and articles culled from the prestigious Scientific American and Scientific American Mind magazines, The Scientific American Book of Love, Sex, and the Brain offers a fascinating look at how the brain controls our loving relationships, most intimate moments, and our deep and basic need for connection.

Gathers research from the fields of biology, genetics, psychology, and sociology in an examination of the meaning and importance of love

Stereotypically, science and emotion are diametric opposites: one is cold and unfeeling, the other soft and nebulous; one is based on proven facts while the other is based on inexplicable feelings and "never the twain shall meet," until now. John Gottman delves into the unquantifiable realm of love, armed with science and logic, and emerges with the knowledge that relationships can be not only understood, but also predicted as well. Based on research done at his Love Lab and other laboratories, Gottman has discovered that the future of love relationships can be predicted with a startling 91% success rate. These predictions can help couples to prevent disasters in their relationships, recognize the signs of a promising relationship, and perhaps more importantly, recognize the signs of a doomed one. Principia Amoris also introduces Love Equations, a mathematical modeling of relationships that helps understand predictions. Love Equations are powerful tools that can prevent relationship distress and heal ailing relationships. Readers learn about the various research and studies that were done to discover the science behind love, and are treated to a history of the people, ideas, and events that shaped our current understanding. They also learn about: "The Four Horsemen of the Apocalypse" "45 natural principles of love" "5 couple types" "5 recipes for good relationships" And much more! Just as science helped us to understand the physical world, it is helping us to understand the emotional world as well. Using the insights in this book, mental health professionals can meaningfully help their distressed clients, as well as better understand why a relationship is failing or succeeding. Appropriate for the curious non-mental health professional as well, Principia Amoris is a must-have on any bookshelf!

Long before he became one of the world's most celebrated immunologists, Jan Vilcek began life in Slovakia as the child of Jewish parents at a time when Jews were being exterminated all across Europe. He owes his and his mother's survival to the courage of brave people and good luck. As a young man growing up in Czechoslovakia in the aftermath of the Second World War, Vilcek went to medical school and chose a career in virology and immunology at a time when these fields were still in their infancy. While still in his twenties he published a paper in the prestigious journal Nature, and he hosted the first international conference on interferon. Fleeing Communist Czechoslovakia with his wife Marica, Vilcek continued his research at NYU School of Medicine, going on to establish a highly successful career in biomedical research, and creating one of the most important and trailblazing medicines of our age. After his arrival in the US in 1965 as a penniless refugee, he soon went on to spearhead some of the key advances in the research of interferon that enabled its therapeutic application, and through his research into tumor necrosis factor (TNF) made advances that led to the discovery of new genes and proteins and signaling pathways, opening up previously uncharted areas of medical innovation that have led to important new treatments for a wide range of autoimmune and inflammatory diseases. Along the way Vilcek acquired material wealth he had never aspired to, catapulting him into the world of philanthropy. Love and Science shows how advances in science sometimes result from the greatest disappointments, and how achievement in medical research is usually a team effort, where ideas are shared, where friendship and love sometimes matter most and serendipity is as important as a will to succeed—and where, over time, the least expected thing sometimes becomes the most important. In Vilcek's case the vaunted cure for cancer that many saw in TNF never materialized. However, out of the ashes of that hope came many related treatments that have changed countless lives and alleviated much

suffering.

The bestselling author of *Hold Me Tight* presents a revolutionary new understanding of why and how we love, based on cutting-edge research. Every day, we hear of relationships failing and questions of whether humans are meant to be monogamous. *Love Sense* presents new scientific evidence that tells us that humans are meant to mate for life. Dr. Johnson explains that romantic love is an attachment bond, just like that between mother and child, and shows us how to develop our "love sense" -- our ability to develop long-lasting relationships. Love is not the least bit illogical or random, but actually an ordered and wise recipe for survival. *Love Sense* covers the three stages of a relationship and how to best weather them; the intelligence of emotions and the logic of love; the physical and psychological benefits of secure love; and much more. Based on groundbreaking research, *Love Sense* will change the way we think about love.

An exploration of human behavior examines the innate aspects of love, sex, and marriage, discussing flirting behavior, courting postures, the brain chemistry of attraction, divorce and adultery in societies around the world, and more. Reprint.

A revolutionary new study of the origins of love based on physiological research probes the human brain for insights into the origins of the sex drive, romance, and attraction, while also offering practical advice on how to control and channel these desires into healthy pursuits. Reprint. 60,000 first printing.
