To run the forecasting models in 'R', we need to convert the data into a time series object which is done in the first line of code below. The 'start' and 'end' argument specifies the time of the first and the last observation, respectively. The argument 'frequency' specifies the number of observations per unit of time.

Forecasting is required in many situations. Stocking an inventory may require forecasts of demand months in advance.

Telecommunication routing requires traffic forecasts a few minutes ahead. Whatever the circumstances or time horizons involved, forecasting is an important aid in effective and efficient planning. This textbook provides a comprehensive introduction to forecasting methods and presents enough information about each method for readers to use them sensibly.

Once the model has been introduced it is used to generate synthetic data, using R code, and these generated data are then used to estimate its parameters. This sequence enhances understanding of both the time series model and the R function used to fit the model to data. Finally, the model is used to analyse observed data taken from a practical application. By using R, the whole procedure can be reproduced by the reader. Automated applications such as forecasting flight delays, web keyword search volume, and weather. Forecasting is heavily used in many areas outside of business, such as in demography and climatology. This book introduces readers to the most popular statistical models and data mining algorithms used in practice. It covers issues relating to different steps of the forecasting process, from goal definition through data collection, visualization, pre-processing, modeling, performance evaluation to implementation and communication. The third edition offers improved organization, updated software screenshots, and additional material.
