"High resolution" is a relative term. Compared to a low-resolution image, high-resolution images have more pixels, lower compression, or both. These images have a higher quality, and also a larger file size. High-resolution rasterized images, such as photographs, appear crisper and more distinct.

High-resolution images are clear even when you zoom in or print them out on a large paper or billboard. They will look the same in all sizes and you won't be able to see individual pixels. Low-resolution images, on the other hand, become fuzzy when you zoom in, and curved lines look like they are made from many tiny squares.

Higher resolution photos are clearer and contain more detail. Digital image resolution is expressed as pixels (or dots) across by pixels down, such as 640 x 480, meaning 640 pixels across by 480 pixels down. The best printable resolution is 300 dots per inch. applies to raster digital images, film images, and other types of images. Higher resolution means more image detail. Image resolution can be measured in various ways. Resolution quantifies how close lines can be to each other and still be visibly resolved. Resolution units can be tied to physical sizes, to the overall size of a picture, or to angular subtense. Line pairs are often used instead of lines; a line pair comprises a dark line and

During the last 20 years interest in high-resolution x-ray

diffraction and reflectivity has grown as a result of the development of the semiconductor industry and the increasing interest in material research of thin layers of magnetic, organic, and other materials. For example, optoelectronics requires a subsequent epitaxy of thin layers of different semiconductor materials. Here, the individual layer thicknesses are scaled down to a few atomic layers in order to exploit quantum effects. For reasons of electronic and optical confinement, these thin layers are embedded within much thicker cladding layers or stacks of multilayers of slightly different chemical composition. It is evident that the interface quality of those quantum wells is quite important for the function of devices. Thin metallic layers often show magnetic properties which do not appear for thick layers or in

bulk material. The investigation of the mutual interaction of magnetic and non-magnetic layers leads to the discovery of colossal magnetoresistance, for example. This property is strongly related to the thickness and interface roughness of covered layers.

High-resolution electron microscopy (HREM) has become a most powerful method for investigating the internal structure of materials on an atomic scale of around 0.1 nm. The authors clearly explain both the theory and practice of HREM for materials science. In addition to a fundamental formulation of the imaging process of HREM, there is detailed explanation of image simulation indispensable for interpretation of high-resolution images. Essential information on appropriate

imaging conditions for observing lattice images and structure images is presented, and methods for extracting structural information from these observations are clearly shown, including examples in advanced materials. Dislocations, interfaces, and surfaces are dealt with, and materials such as composite ceramics, high-Tc superconductors, and quasicrystals are also considered. Included are sections on the latest instruments and techniques, such as the imaging plate and quantitative HREM.

Recent innovations in modern radar for designing transmitted waveforms, coupled with new algorithms for adaptively selecting the waveform parameters at each time step, have resulted in improvements in tracking performance. Of particular interest are waveforms that can be mathematically designed to have reduced ambiguity function sidelobes, as

their use can lead to an increase in the target state estimation accuracy. Moreover, adaptively positioning the sidelobes can reveal weak target returns by reducing interference from stronger targets. The manuscript provides an overview of recent advances in the design of multicarrier phase-coded waveforms based on Bjorck constant-amplitude zero-autocorrelation (CAZAC) sequences for use in an adaptive waveform selection scheme for multiple target tracking. The adaptive waveform design is formulated using sequential Monte Carlo techniques that need to be matched to the high resolution measurements. The work will be of interest to both practitioners and researchers in radar as well as to researchers in other applications where high resolution measurements can have significant benefits. Table of

Consolidating current information about image clarity, this book offers insights into the principles of resolution and sorts out, from conflicting philosophies, those techniques that are consistent with these principles. It also discusses, for the first time anywhere, such topics as the theory of image degradation, principles of ground resolution, image legibility, reduction and enlargement latitude, spread radius, and the degradation equation.

Photoemission spectroscopy is one of the most extensively used methods to study the electronic structure of atoms, molecules, and solids and their surfaces. This volume introduces and surveys the field at highest energy and momentum resolutions allowing for a new range of applications, in particular for studies of high temperature superconductors.

At the heart of this important new book is the tension between literacy and the open acknowledgement of discrepancies within social and linguistic fields on the one hand, and what Sussman terms the resolving function, the utopian picture of harmony depicted by the state and large organizations, on the other. After discussing some examples of the resolving

function--Barthes's notion of the myth, Kundera's fictional treatment of kitsch, and contemporary television--Sussman draws on a line of theoretical inquiry extending from Saussure to Derrida in order to put forth a differential model of literacy in which the skills necessary to participate productively in culture are more disjunctive than associative in nature.

Awareness of the discrepancies set into play by language is necessary, he argues, for both the individual and the society to understand the complex and sometimes contradictory web of socioeconomic, political, and semiological relations in which they are involved. Combining literary theory with close textual readings of works by Hawthorne, Melville, Wallace Stevens, Ezra Pound, William Carlos Williams, and Italo Calvino, this book is the first to explore the socio-political
